

CIRCUIT AND TRACK (Including chassis setup)

RS08 - Subaru STi RM08 - Mitsubishi Evo

SPECIFICATION

This precise system allows the use of a softer spring than normal, giving the tyres an easier life. The high spec damper gives improved support and roll control with a big increase in mechanical grip from the tyres.

One Way Adjustable Damper

The improved sensitivity of low speed damping, results in increased mechanical grip and control of pitch and roll.

(TiAlN) Low Friction Installation

The combination of a full twin tube strut, with titanium aluminium nitrided (TiAlN) running surfaces guided in a floating bush system results in very low friction. Consistent performance over a wide temperature range.

Spring Thrust Bearings

Frees up the spring movement.

Independent Steering Alignment Bearings

Lighter steering loads

Lightweight Competition Springs

Weight saving of up to 1kg per corner.
